

Floor Based Stand & Total Care Lift Options

Sit-to-Stand Lifts are a vital part of any early ambulation program. Patients who are up more often, building leg strength, and able to toilet on their own recover quicker with less complications.

The lifts we represent are all made in the USA and come in weight capacities of 400#, 500#, and a true bariatric version capable, fitting and supporting your patients of size up to 800#.

Each lift comes with an on-board battery pack along with a complete second battery/charging pack station that can be wall mounted. With no cords attached to the lift, you can position your lift where it needs to be, rather than where an outlet is located.

Floor based total care lifts are always needed even in facilities with overhead lift coverage.

Our total care mobile floor lifts come in weight capacities of 500#, 600#, 750#, and even up to 1000#s.

Optional scales are available on all these lifts, and the 500# and 600# lifts can be fit with a special low clearance base which gets under the bar on all new stretchers.

Each lift comes with an on-board battery pack along with a complete second battery/charging pack station that can be wall mounted. With no cords attached to the lift, you can position your lift where it needs to be, rather than where an outlet is located.
